Field log -- LOCATION: American Produce Council, Aurora, Illinois. DATE & TIME: July 22, 1:30 p.m. LOG: Enter P.C. compound in vegetable truck, posing as large eggplant. Break in room during lunch. Discover GROWN-UP RULE #3 through crowded cafeteria claiming to be leftover moussaka.

To keep them under control! Millions of years ago, vegetables ruled the earth. Big bunches of broccoli stomped through the jungles, followed by ferocious carrots and savage packs of peas. Huge heads of lettuce roamed the grasslands, and giant celery stalked the plains. And what were these terrible vegetables looking for? You guessed it... People! Yes, these were meat-eating vegetables.

They terrorized the early humans, attacking without warning. Our ancestors put up with this for centuries, living in drafty caves and getting nasty head colds. But then they discovered sticks and stones. With these new weapons, humans began to defend themselves. At first, lone hunters would take on a single radish or green bean. Eventually, groups of hunters tackled bigger game, like the saber-toothed asparagus and woolly cucumber. By mixing these vanquished vegetables, primitive chefs invented salad.

The real turning point, however, was the discovery of fire. With it, hunters could frighten the less intelligent vegetables into ambushes and traps. Thousands of butternut squash, frightened by hunters' fiery torches, plunge over a cliff in what is now France. Scientists believe this incident gave squash its name. Courageous humans confront a fully grown cornasaur, using their torches to fatally overheat the beast's vital kernels. More important, fire allowed humans to cook their leafy foes. As this fossil from Montana shows, predatory potatoes and man-eating mushrooms were turned into Stone Age casseroles.

This brought the Age of Vegetables to a close. As the human race grew in size and intelligence, vegetables became smaller and dumber, devolving into the pathetic produce of gardens and grocery stores. To prevent vegetables from ever regaining power, grown-ups eat them. They don't like the flavor any more than you do, but it keeps the little horrors fearful and demoralized. It's a simple way to protect modern civilization. Besides, which would you rather do: eat your vegetables or be eaten by vegetables?

Field log -- LOCATION: United Dairies Corporation, Des Moines, Iowa. DATE & TIME: July 31, 1997, 11:30 p.m. LOG: Disguised as Polled Guernsey, lead herd of cows into high-security area. During melee, locate GROWN-UP RULE #37. Abandon disguise, disappointing bull. Close call.

To stop our atomic cows from exploding! Kids have been told that millions of cows produce our country's milk. That's not true. At this moment, only five giant cows do all the work. The others are decoys made of plywood and old box springs. One of these colossal cows is Flossie. Eighty feet tall, she provides the daily milk supply for Utah, Nevada, Wyoming, and

Colorado. Flossie is kept under tight security at a secret air-force base, right next to the hangar where they stack all the banged-up flying saucers.

Flossie's size is no accident. In the 1950s, our government was afraid that the Russians would develop the first atomic cow and flood the market with Communist milk. To prevent this, American scientists fed Flossie and her friends radioactive hay.

The experiment worked great, and government officials are very happy that all this milk is available. But they worry about one thing: Flossie can't be turned off. The milk just keeps coming. For this reason, all atomic cow sites are equipped with extra milking machines. For backup, glass cases on the wall contain emergency farmers with really big hands. However, there is one crisis the government can't prepare for: kids not drinking milk. If that happened, Flossie would have to hold it. Oscar Larsen served as an emergency milker for the Wisconsin Atomic Cow Project, spending eighteen years in a glass case. "You learn a lot in a place like that," said Larsen. "I just can't remember what it was."

Getting bigger and bigger until nuclear milkdown! Such a catastrophe forever scars the landscape between the Arizona towns of Flagstaff and Winslow. A huge crater is all that remains of Doris, the only atomic cow that ever exploded. When kids felt the ground shake and saw the curdled cloud of dairy products form over the desert back in 1962, they were told that a meteor had hit the local Tastee Freeze. Now you know better. So drink your milk.

To stop it from going back into those little holes in your head! Yes, that's right! Hair doesn't grow out. Hair grows in! Why else would you pull it around with a comb? After all, you only pull things when they want to go the other way. Within the scalp, thousands of powerful sumo cells drag individual hairs into the head. The hair passes through the skull (which protects the brain from shock) after traveling through a layer of fat (which protects the brain from thinking).

The proof of Reverse Hair Growth (RHG) can be found in the following time-lapse photography of a newborn baby. Notice that the infant arrives with an abundance of hair. This is entirely normal. Then the sumo cells begin their lifelong work. Within moments, a short-haired baby is presented to gullible brothers and sisters, who stroke the baby's head, thereby preventing complete baldness. Because most girls brush and comb their hair a lot, they don't have to worry much about Reverse Hair Growth. Boys do, not only because they don't comb much, but also because many get very short haircuts. RHG happens so fast, a flattop or crew cut can grow back into a guy's head in one night!

Luckily, there are two ways to avoid this danger: 1. Blow on your thumb. This raises your body's air pressure and creates internal wind gusts of seventy-five MPH, forcing sumo cells to release the hair shafts. Do not be alarmed if you hear a slight whistling noise when you do this; it is only extra air coming out your ears. 2. Chew gum. Microscopic gum molecules find their way to the inside of your head, where they stick to the sumo cells for at least forty-eight hours. Chewing more gum will extend this time. But what if you get really careless and don't comb your hair and it all grows back inside your head? Two things will happen: 1. You will be bald. 2. Your head will be stuffed with ingrown hair. This doesn't leave much room for brains. Then you will be bald and kind of stupid.

However, all is not lost. Nature is wonderful and takes care of Cranial Hair Overload (CHO) in a couple of great ways: 1. It directs the hair to grow someplace else. This is why so many bald guys have beards and mustaches. It is a known fact that William Shakespeare sprouted a

mustache and goatee to alleviate the brain crowding caused by CHO. 2. It relocates the brain to a place that has more room, like a briefcase or a hat. For instance, British leader Winston Churchill kept his brain in a bowler hat for many years, then switched it to a bomb-proof briefcase when World War II began. The next time you spot a bald guy, see if he wears a beard, a mustache, or a hat, or if he carries a briefcase. If he does, chances are he's pretty smart. If not, talk slowly and don't use any big words, because he's probably a dope.

Field log -- LOG: Enter premises within chocolate milk shake. Find GROWN-UP RULE #56 in storeroom! Flippers stick to floor; must leave behind. Security arrives. Roll on carpet, picking up lint. Make getaway as giant fuzz ball.

That sucks your face right into the glass! Kids don't know it, but thousands of these incidents happen every year. That's why all grown-ups keep an Emergency Suckface Kit with a hammer and crowbar within easy reach of the dinner table, where most milk-related accidents occur. Unfortunately, a quick rescue seldom prevents the hideous result of having your face sucked into a glass.

Because of their unusual features, suckfaced survivors once faced cruel taunts and demeaning careers of licking stamps and blowing up balloons. However, recent advances in face masks have allowed many of the afflicted to reenter society. As these dramatic before and after photographs show, many talented, prominent citizens have returned to lead fulfilling and productive lives. Albert Einstein. Elvis Presley. Pablo Picasso. Groucho Marx. Richard Nixon. But why give yourself problems? Don't blow bubbles in milk with a straw. And never, never blow bubbles into a soda bottle.

That the food will want to play with you! Honestly, it doesn't take much to get food to play. And once it starts, it's almost impossible to stop. That's when things get messy. (The only exception is food from the school cafeteria, which is so depressed about its career that it won't react to anything.)

Even bland foods can be a challenge. Oatmeal keeps playing gin rummy even after the cards stick together. Poached eggs spend so much time on crossword puzzles that the paper falls apart. And applesauce plays checkers long after you can't see the board anymore. This stubborn playfulness increases with spicy foods. Tacos insist on tag, then get salsa all over the couch. Swedish meatballs beg to play soccer, but always leave gravy on the rug. Some foods are simply too rough to play with. Fried chicken loves to play chicken. As illustrated above, children and chicken parts rush at each other at high speed until one side moves out of the way. Pork can also be dangerous. Unless thoroughly cooked, it plays this little piggy went to market, which often ends with sprained toes. Knowing all this usually stops kids from playing with their food. If not, make sure you wear a helmet and knee pads to dinner. That steak could be tougher than it looks.

Field log -- LOCATION: Cozy Comfort Mattress Company, Lorgnette, Oregon. DATE & TIME: January 17, 1998, 4:30 a.m. LOG: Disguised as bedbug, enter loading dock. Find GROWN-UP RULE #62 in stuffing bin. Get sprayed by janitor. Play dead. Swept up in dustpan. End in garbage.

If you wake up the mattress! You see, mattresses aren't just big lifeless rectangles crammed with stuffing. They are active woolly creatures raised on farms in Scotland.

There, the mattress herders (or mattherds) sing a lovely ballad as their frisky mattdogs guide the beasts to pasture: "Mattresses are bonny things, Born of stuffing, cloth, and springs. Gaily

now they graze the meadow, Growing soon to be my bed. Oh! Single, double, queen, and king, A flock like this doth make me sing! Methinks my joy shall never wilt! By gar! The beasties just ate my kilt!" After growing to adulthood, the mattresses start a long period of hibernation. Undisturbed by noise and handling, they are rounded up, sorted by size, and sold to stores. Then they end up in your bedroom, where they snooze peacefully year after year. Unless you jump on them. Fortunately, today's mattresses are very difficult to wake up. That wasn't the case with their hardy ancestors.

When the first Scots arrived in Scotland by parcel post more than six thousand years ago, they saw wild mountain mattresses jumping from peak to peak. By imitating the creature's mating call with bagpipes, the Scots tried to capture one. But none succeeded. Then one night, about A.D. 1040, the Scottish king Malcolm the Upset wandered the moors, trying to get over eating haggis, *a real humdinger of a national dish. He stumbled upon a hibernating mattress, upon which he slept soundly for the first time in many years. When he woke, Malcolm realized that the wild mattress was more comfortable than the boulder he usually slept on.*

King Malcolm brought the mattress home and began breeding it. Soon he was giving mattresses as gifts to other kings and queens. Unfortunately, these feral mattresses woke up and started slinging royalty around, an event immortalized on canvas by court artist Red Harry McLegs, who was five years old at the time. This was very bad for King Malcolm, who spent the rest of his life in prison, eating haggis. But it was very good for us -- we now have the modern domestic mattress with its mild disposition and long hibernation period. Still, it's not a good idea to jump on your bed. That mattress might be hard to wake up, but it's not impossible. And, for goodness' sake, don't play the bagpipes near it!

They growl. Just like carrot seeds become carrots and bean seeds become beans, fingernail scraps become fingers. After growing under your bed or between the sofa pillows for about three months, the new fingers leave their nests and go crawling around the house. At first, this isn't too much of a problem. With their dimpled knuckles and sunny dispositions, the baby fingers are actually kind of cute. But as they get older, the fingers start behaving badly.

They ring your doorbell and run. They dial long-distance to order anchovy and onion pizza delivered to people you don't know. They swipe the icing off cakes and poke chocolates to find out what the fillings are. Psychologists think that the fingers act this way because they grow up alone without ever belonging to a hand. Upon adolescence, the fingers form groups to make up for it. And that's the most important reason not to bite your fingernails:

To stop the spread of teenage finger gangs! These gangs are based on physical characteristics. They are: 1. The Stubby Creeps. This band of disturbed thumbs travels by hitchhiking. They get a kick out of making sudden jerky movements and yelling, "Take a hike!" Gang leaders wear black T-shirts with "I'm Opposable!" scrawled on them. 2. The Pointing Punks. These rebellious forefingers pointlessly scold and accuse people. They are often busted for picking noses that don't belong to them. For laughs, they'll poke you in the eye.

3. The Dirty Digits. This bunch of middle fingers just stands around. That's bad enough. 4. The Ring Leaders. These boisterous ring fingers spend most of their time showing off flashy jewelry. Unlike members of other gangs, many are engaged or even married. 5. Heil's Pinkies. This pathetic group of little fingers tries to imitate the Ring Leaders by wearing jewelry. Psychologists think they do it because they're self-conscious about their height and have rotten jobs cleaning ears. So do society a favor: Stop biting your fingernails. If you can't break

the habit, dispose of the scraps properly by sending them to an accordion factory. They use lone fingers to test accordions because most normal people don't want to listen to them.

To stop your brain from deflating! The air pipeline that keeps your brain inflated runs past the nostrils to a vast pumping station inside your head. There, floating majestically from its moorings, linked to thousands of ingrown hairs, is the magnificent human brain, swaying gently in the breeze. Until you stick a finger up your nose. This intruding digit will certainly dent the pipeline. It may even poke a hole in it, causing an outburst of air called, in technical language, a sneeze. This minor damage is quickly patched by alert mending muscles. Microphotography captures the horror of helpless mending muscles as the brain of inveterate nosepicker Lindsay Hindenburg of Lakehurst, New Jersey, deflates in spectacular fashion.

More aggressive techniques, such as the use of knuckles or toes, result in complete pipeline failure. Should poking of this magnitude continue, the brain becomes unhooked from the pipeline and deflates. If you can't give up this nasty habit right away, at least be familiar with the five warning signs of brain deflation: 1. A faint hissing noise. 2. A sound like a balloon let loose in a bathtub. 3. A rubbery thumping as your brain flies around. 4. Silence. 5. A floppy rolling noise when you tilt your head. Although this baggy brain still works, it won't absorb much new information, so it pays to fix it before the next spelling test. Here's the simple way: 1. Shine a flashlight up your nose. Just as a plant turns toward the sun, your brain will be attracted to the light shining up your nose and flop over to it. Your brain will then be centered over the pipeline, ready for inflation. 2. Hold your nose and hum. Finger pressure stabilizes the pipeline. Humming entertains the mending muscles as they drive bulldozers around to fix things up. There is a more difficult way to reinflate your brain, but it requires four years of college, one pair of pliers, and three feet of lead pipe.

Removed from the story flow during cleanup (book prose preserved word for word; page refs are PDF pages):

- Page map for field-log spreads: field logs open the rules on PDF pages 8, 14, 26 and 34. The "(PDF page N)" suffixes on each "Field log" line were our labels and have been stripped; the book's own "Field log" headings are kept.
- PDF page 8: "" after "GROWN-UP RULE #3" -- a word or words in the rule statement are unreadable in the text layer.
- PDF page ~11: illustration caption on the cornasaur page illegible in the text layer (was inline after "vital kernels").
- PDF page ~12: timeline illustration reading "1,000,000 B.C., 100,000 B.C., 8,000 B.C., 3,000 B.C., TODAY" (was inline after "grocery stores").
- PDF page ~12: "your" in "eat your vegetables" was bracketed as uncertain in the layer (""); brackets removed, word kept.
- PDF page ~15: map "ATOMIC COW REGIONAL SITES -- Doris (Arizona), Enid (Tennessee)" (was inline after "radioactive hay").
- PDF page ~16: "Marginal note:" prefix before the Oscar Larsen emergency-milker anecdote was our label; anecdote kept as prose.
- PDF page ~18: diagram labels "Skull" for the hair-growth diagram (was inline after "from thinking").
- PDF page ~44: "Caption:" prefix before the Lindsay Hindenburg brain-deflation microphotography sentence was our label; sentence kept as prose.

- PDF page 50 (closing page): illegible in the text layer -- a few garbled fragments only; see the OCR review notes file. Not included as story prose.
- Each rule opens with a field-agent log spread (location, date, disguise, rule number) illustrated as a spy-dossier scene; the logs frame the whole book as a secret-agent investigation.
- The vegetable section pairs prehistoric scenes (broccoli jungles, saber-toothed asparagus, cornasaur, squash cliff, fossil casserole) with a B.C.-TODAY evolution timeline.
- The atomic-cow section pairs a secret air-force base, regional-sites map, emergency-farmer glass cases, and the Flagstaff-Winslow crater with period-photo-style portraits (including the quoted emergency milker).
- Later rules pair diagram-style illustrations with the prose: skull/fat-layer hair diagram, newborn time-lapse photos, Emergency Suckface Kit, chicken-playing-chicken scene, mattress-herder ballad and royal-slinging canvas, finger-gang portraits, and the brain-pipeline microphotography.

Story text transcribed from the embedded text layer (PDF pages 8-50), joined across line breaks; the mattherd ballad and finger-gang lists kept in their printed order. Square brackets mark words illegible or uncertain in the layer rather than guessed. Cover and title-page text (pages 1-2), the coded/transmission pages (3-7), blank/illustration-only pages, and the garbled closing page (50) are not included as story prose. Pixel-level visual verification against the rendered scans has not yet been completed -- my image-reading tool is currently unavailable, so please check the transcript against the PDF before treating it as final.
